

KARE

The Chemistry of Exceptional Hair

Men's Advanced Conditioning Formula

Precision-engineered. Science-backed. Built for men.

The Science of Men's Hair

Hair is not just a fiber — it is a complex biological structure with three distinct layers, each requiring targeted chemistry to remain healthy, strong, and resilient under daily stress.

How KARE Works — Inside the Hair Shaft

Fig 1 — Cross-section of a hair shaft showing KARE's active ingredient delivery zones.

Most men's hair faces a specific combination of challenges:

- **Mechanical stress** — daily styling, combing, environmental friction strip the cuticle.
- **Sebum build-up** — active scalp glands leave heavy residue that clogs follicles.
- **Protein loss** — heat, UV, and hard water leach keratin from the cortex.
- **Dehydration** — razor-short styles expose more scalp surface to moisture loss.

THE ELECTROSTATIC PRINCIPLE

Human hair carries a **net negative charge** when wet. KARE's positively charged actives are drawn to the hair surface like a magnet — sealing the cuticle precisely where it needs protection.

Key Ingredients & Their Chemistry

Five precision-selected actives, each with a specific molecular role in the conditioning matrix:

01

Cetrimonium Chloride

$C_{18}H_{37}ClN$ — Quaternary Ammonium Salt

Function: Cationic surfactant that adsorbs electrostatically onto the anionic hair surface. Forms a thin, uniform monolayer that reduces friction between strands.

Benefit: Instant detangling, reduced static, defined style without weight.

02

Hydrolyzed Keratin*Protein fragments (MW 1,000–10,000 Da)***Function:** Low-molecular-weight keratin peptides that penetrate the cortex through the cuticle pores. They cross-link with internal disulfide bonds to reinforce weakened hair architecture.**Benefit:** Visibly repaired, stronger hair with up to 40% less breakage.

03

Panthenol (Pro-Vitamin B₅)*C₁₀H₁₉NO₂ — Pantothenic acid alcohol***Function:** A powerful humectant that binds up to three times its weight in water. Converted to pantothenic acid inside the cortex where it integrates into the hair's own moisture reservoir.**Benefit:** All-day hydration, improved elasticity, and natural shine.

04

Cetyl Alcohol*C₁₈H₃₇O — Long-chain fatty alcohol***Function:** Acts as both emollient and emulsifier. Creates a smooth, lubricating film over the cuticle surface and stabilises the water-oil emulsion in the formula so active compounds remain evenly distributed.**Benefit:** Silky texture in hand; smooth, manageable hair after rinsing.

05

Argan Oil (Argania spinosa kernel oil)*Rich in oleic acid (C18:1), linoleic acid (C18:2), and α -tocopherol (Vit E)***Function:** Lipophilic fatty acids permeate the hydrophobic cortex and fill micro-fractures caused by heat and UV exposure. Vitamin E neutralises free radicals that degrade the hair's disulfide bond network.**Benefit:** Restored lustre, UV protection, and long-term structural resilience.

Ingredient Efficacy Profile

Fig 2 — Comparative efficacy index for Smoothing, Moisture retention, and Repair across KARE's five active ingredients.

The pH Advantage

pH is the most overlooked variable in hair care chemistry. KARE is formulated at **pH 4.5** — precisely matching the natural isoelectric point of healthy hair. This tight alignment triggers the cuticle to close flat, maximising shine and minimising porosity after every wash.

Fig 3 — pH zones relative to KARE's target formulation point.

pH Effects on the Cuticle

At **pH 4–5** (KARE): cuticle scales lie flat, reflecting light uniformly → high shine, low porosity.

At **pH 6–7** (standard shampoo): cuticle partially lifts, surface becomes rough → dull, frizzy appearance.

At **pH 8+** (alkaline): cuticle fully opens, cortex exposed to protein leaching and mechanical damage.

How to Use KARE

1	Cleanse Wash with a sulphate-mild shampoo (pH 5.5–6) to avoid alkaline shock.
2	Apply Dispense a coin-sized amount and distribute through damp hair, avoiding the scalp — let the cationics bind where damage is highest.
3	Dwell Leave on for 2–3 minutes. Panthenol requires time to cross the cuticle barrier and saturate the cortex.
4	Rinse Rinse with cool water to encourage cuticle closure and seal the conditioning layer in place.

OUR PROMISE

KARE is not skincare imitating haircare.
It is **hair chemistry, perfected for men.**
